

Abstract

5 A formulation in the form of a matrix material-containing compound with an excipient phase with at least one excipient and/or an active substance phase with at least one active substance and a matrix material phase with at least one polymer and/or lipid is described.

10 The invention is distinguished by the fact that the matrix material phase (polymer or lipid) of the formulation is incoherent and that the excipient and/or active substance phase of the formulation is coherent.

15 A process for the preparation of the formulation according to the invention is furthermore described.

20 The formulation according to the invention is suitable for the preparation of larger matrix units with controlled release properties by known processes, and in particular for the preparation of tablets by means of direct compression.
